

## Silicone Masks

The new silicone masks are made of medical grade silicone because this is generally considered the material of choice for its superior ability to conform to the patient's anatomy.

MT-3087-2008

In addition, this material is resistant to high or low temperature and durable. The new silicone masks can be autoclaved and thus they can be reused on multiple patients.

There are different mask designs available. The smaller sizes (sizes 0-2) have a rather round shape in order to provide comfortable fit and effective seal for infants with a more round shaped face contours. The bigger sizes (sizes 3-5) have an anatomically formed teardrop shape to ensure convenient fit and seal to more adult patient's facial characteristics. The new silicone masks have a flexible, soft and transparent mask body.

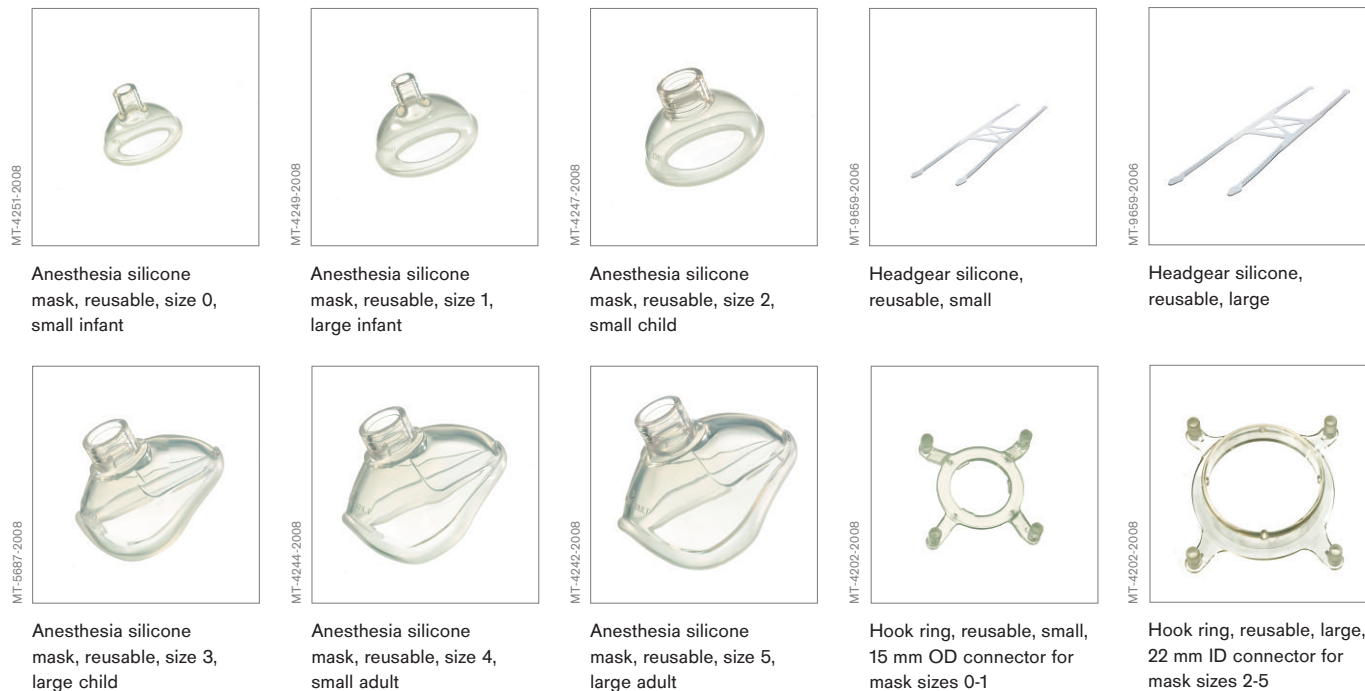

The mask body design allows for a comfortable rest of the thumb. The form and material create an easy grip for the physician. The transparent mask body allows for continuous visual observation of the patient's condition.

Additional mask accessories provide more comfort. Reusable hook rings (small and large) are available for fixation. There are also two different reusable headgears available; a small headgear for mask fixation on infants and children, a large headgear for mask fixation on adults. The reusable headgear are made of silicone. They can be autoclaved and thus can be reused on multiple patients.
